- **NP:** in case that a habitat type no longer exists in the site enter: x (optional)
- **Cover:** decimal values can be entered
- **Caves:** for habitat types 8310, 8330 (caves) enter the number of caves if estimated surface is not available.
- **Data quality:** G = 'Good' (e.g. based on surveys); M = 'Moderate' (e.g. based on partial data with some extrapolation); P = 'Poor' (e.g. rough estimation)

3.2 Species referred to in Article 4 of Directive 2009/147/EC and listed in Annex II of Directive 92/43/EEC and site evaluation for them

- **NP:** in case that a species is no longer present in the site enter: x (optional)
- **Type:** p = permanent, r = reproducing, c = concentration, w = wintering (for plant and non-migratory species use permanent)

- **Unit:** i = individuals, p = pairs or other units according to the Standard list of population units and codes in accordance with Article 12 and 17 reporting (see [reference portal](#))
- **Abundance categories (Cat.):** C = common, R = rare, V = very rare, P = present - to fill if data are deficient (DD) or in addition to population size information
- **Data quality:** G = 'Good' (e.g. based on surveys); M = 'Moderate' (e.g. based on partial data with some extrapolation); P = 'Poor' (e.g. rough estimation); VP = 'Very poor' (use this category only, if not even a rough estimation of the population size can be made, in this case the fields for population size can remain empty, but the field "Abundance categories" has to be filled in)

Other Site Characteristics

La cima del Monte Curcio (1768 m s.l.m.) è uno dei rilievi maggiori dell’Altopiano Silano ed è localizzata a NW rispetto a Monte Botte Donato (1928 m s.l.m.). Le zone delimitate si estendono a valle del Monte Curcio e del colle Macchione (1726 m s.m.l.) dove si raccolgono le acque superficiali e si ritrovano numerose sorgenti anche perenni.La zona è molto umida e ricca di zone paludose; le rocce che affiorano nell’area sono rocce metamorfiche molto alterate di età paleozoica. Dal punto di vista bioclimatico il sito appartiene alla fascia submediterranea superiore della regione temperata, con regime oceanico.

4.2 Quality and importance

Il sito è caratterizzato da un mosaico di firocenosi igrofile, con presenza di sfagnete e prati torbiditici che rappresentano un importantissimo sito di rifugio per molte specie a distribuzione settentrionale, che qui hanno il limite meridionale del loro areale o che si presentano con popolazioni altamente disgiunte dal loro areale principale.
